...	...

- Predict house price.

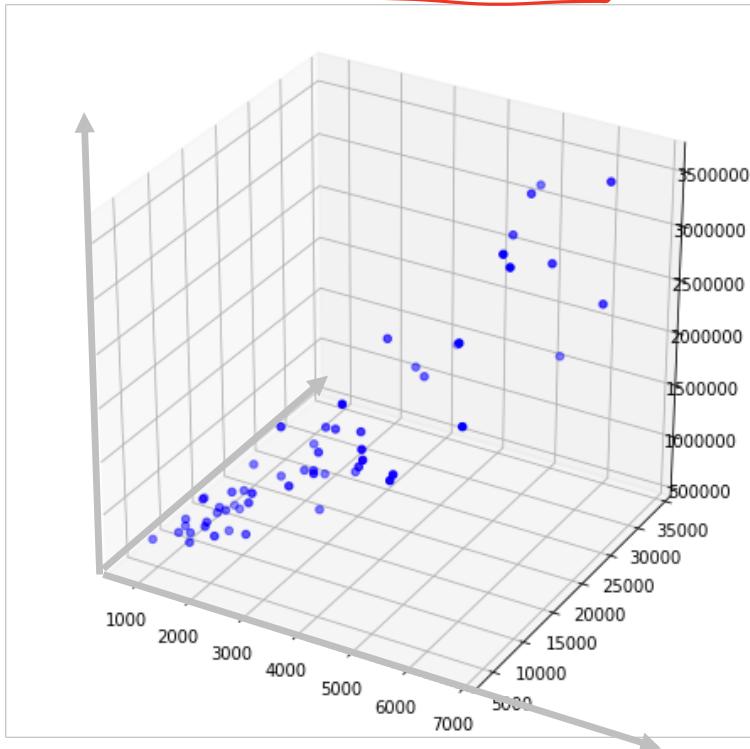

$$h_{\theta}(x) = \theta_0 + \theta_1 x_1$$

➤ Predict house price.

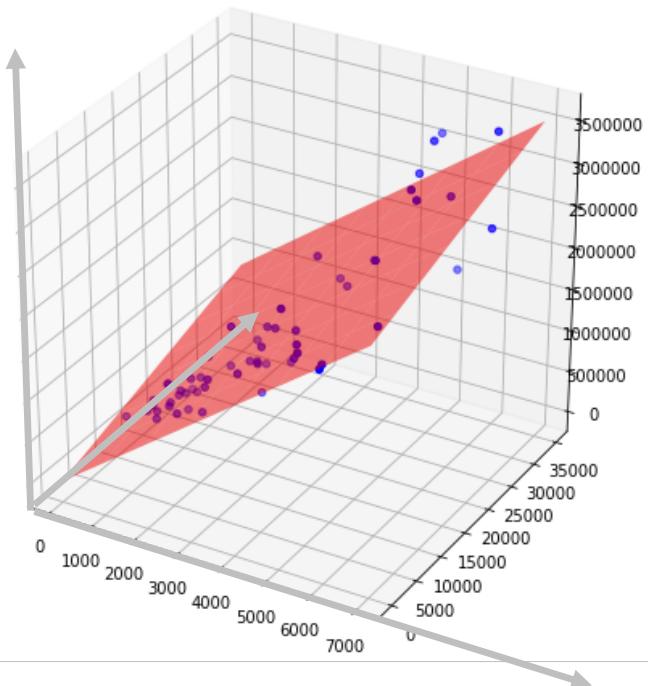

Input: a dataset that contains n samples $(\vec{x}^{(i)}, y^{(i)})$, $i = 1, \dots n$

Task: if a house has x_1 (ft²) living size and x_2 (ft²) lot size, predict its price?

Model: $h_{\theta}(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2$

SQUARE_FEET	LOT_SIZE	PRICE
2969	15014	1090000
1566	5582	805000
2532	6273	905000

6430	30600	3550000
1750	8222	885000
840	5548	630000
...

$$h_{\theta}(x) = \theta_0 + \theta_1 x_1 + \theta_2 x_2$$

➤ Linear Regression (Parametric Method)

Input: a dataset that contains n samples.

$$D = \{(\vec{x}^{(i)}, y^{(i)}), \quad i = 1, \dots, n\}$$

$$\vec{x} = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ \vdots \\ \vdots \\ x_d \end{bmatrix} \xrightarrow{\text{ER } h} \vec{y}$$

x_6	x_1	x_2	x_3	x_4	y
T	SQUARE_FEE	LOT_SIZE	BEDS	BATHS	PRICE
2969	15014	3	3	3	1090000
1566	5582	3	2.5	2.5	805000
2532	6273	4	2.5	2.5	905000
6748	26607	7	4.5	2.5	2660000
4200	20446	4	4	4	1925000
2232	3966	4	2.5	2.5	965000
1344	5559	2	1.5	1.5	775000
2898	12420	3	2.5	2.5	1250000
1729	4171	2	2	2	815000
3149	12616	6	3	3	900000

Assumption: linear model

$$h_{\theta}(\vec{x}) = \theta_0 \vec{x}_0 + \theta_1 x_1 + \dots + \theta_d x_d$$

$$= \sum_{j=0}^d \theta_j x_j = \vec{\theta} \cdot \vec{x} = \begin{bmatrix} \vec{\theta}^T & \vec{x} \end{bmatrix} = \begin{bmatrix} \vec{x}^T & \vec{\theta} \end{bmatrix}$$

$\begin{bmatrix} \vec{\theta} \\ \vdots \\ \vec{x} \end{bmatrix} = \begin{bmatrix} \theta_0 & \theta_1 & \dots & \theta_d \end{bmatrix}$

Model $h_{\theta}()$

Data give us $h_{\theta}(\vec{x}^{(i)}) = y^{(i)}$ for $i = 1, \dots, n$

predict real

Data and linear assumption implies

$$(\vec{x}^{(i)})^T \vec{\theta} = y^{(i)} \text{ for } i = 1, \dots, n$$

Matrix Notation:

$$\boxed{X \vec{\theta} = \vec{y}}$$

$n \times (d+1)$ $(d+1) \times 1$ $n \times 1$

Data Matrix:

$$X = \begin{bmatrix} 1 & x_1^{(1)} & x_2^{(1)} & \dots & x_d^{(1)} \\ 1 & x_1^{(2)} & x_2^{(2)} & \ddots & x_d^{(2)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & x_1^{(n)} & x_2^{(n)} & \dots & x_d^{(n)} \end{bmatrix} = \begin{bmatrix} \vec{x}^{(1)T} \\ \vec{x}^{(2)T} \\ \vdots \\ \vec{x}^{(n)T} \end{bmatrix}$$

Target vector:

$$\vec{y} = \begin{bmatrix} y^{(1)} \\ \vdots \\ y^{(n)} \end{bmatrix}$$

Parameter vector:

$$\vec{\theta} = \begin{bmatrix} \theta_0 \\ \theta_1 \\ \vdots \\ \theta_d \end{bmatrix}$$

$d=1$

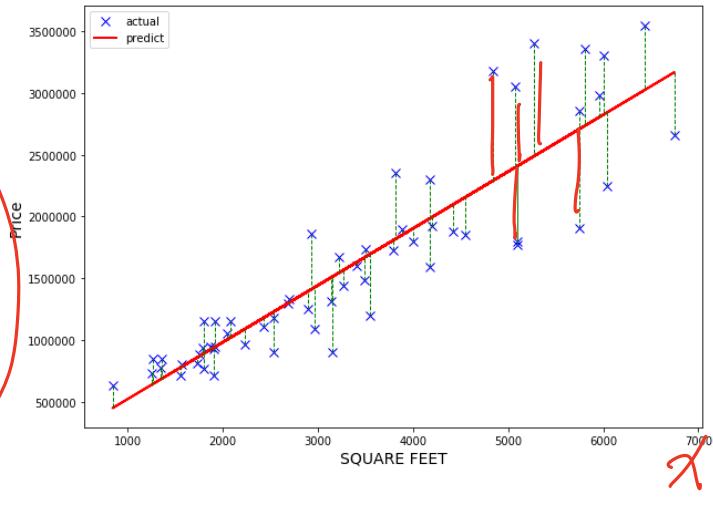

$n=100$

➤ Evaluate the model:

Prediction Vector:

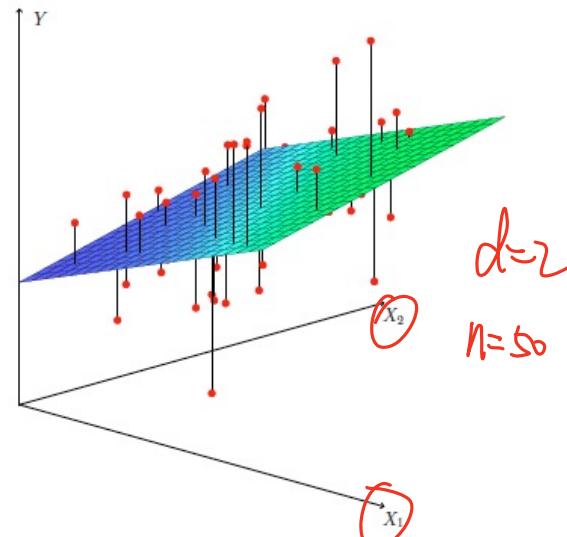

$$h(\vec{X}) := \begin{bmatrix} h(\vec{x}^{(1)}) \\ h(\vec{x}^{(2)}) \\ \vdots \\ h(\vec{x}^{(n)}) \end{bmatrix}$$

$$\vec{y} = \begin{bmatrix} \text{real value} \\ y^{(1)} \\ \vdots \\ y^{(n)} \end{bmatrix}$$

Difference Vector

$$h(\vec{X}) - \vec{y} = \begin{bmatrix} h(\vec{x}^{(1)}) - y^{(1)} \\ h(\vec{x}^{(2)}) - y^{(2)} \\ \vdots \\ h(\vec{x}^{(n)}) - y^{(n)} \end{bmatrix} \in \mathbb{R}^n$$

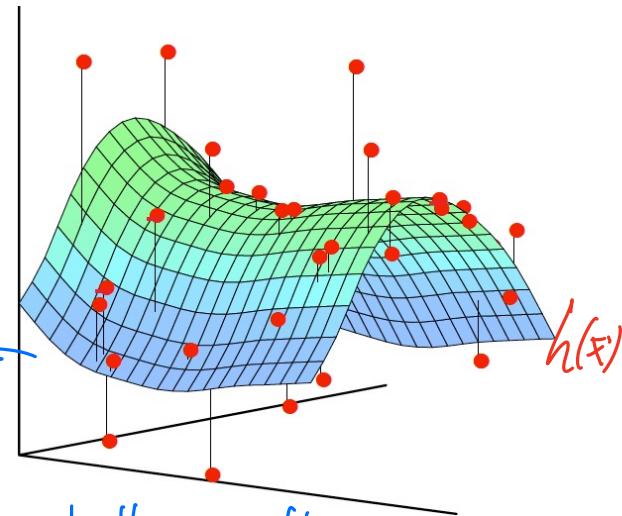

Cost/Loss Functions

Ex

- Mean Absolute Error

$$L(\vec{\theta}) = \frac{1}{n} \sum_{i=1}^n |h_{\theta}(\vec{x}^{(i)}) - y^{(i)}| = \frac{1}{n} \|h(\vec{x}) - \vec{y}\|_1$$

Ex

- Mean Residual Sum of Squares

$$L(\vec{\theta}) = \frac{1}{n} \sum_{i=1}^n (h_{\theta}(\vec{x}^{(i)}) - y^{(i)})^2 = \frac{1}{n} RSS(\vec{\theta}) = \frac{1}{n} \|h(\vec{x}) - \vec{y}\|_2^2$$

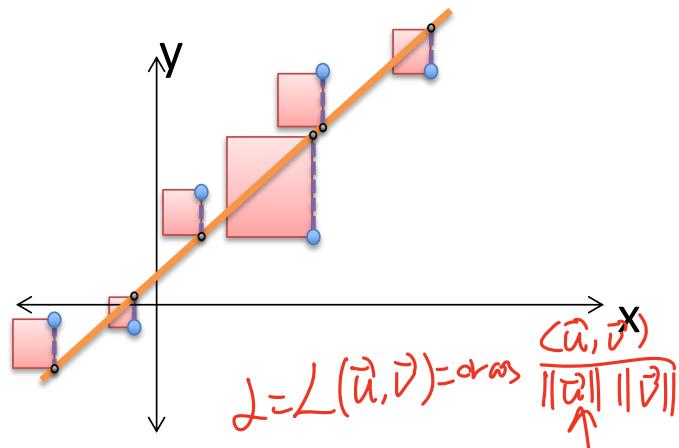

Picture Interpretation of RSS

- Residual Sum of Squares (RSS):

$$RSS(\vec{\theta}):= \sum_{i=1}^n (h_{\theta}(\vec{x}^{(i)}) - y^{(i)})^2$$

Dot prod. $= \|h_{\theta}(\vec{x}) - \vec{y}\|^2$ norm

 $\vec{u} \cdot \vec{v} = u_1 v_1 + \dots + u_n v_n$
 $\|\vec{u}\| = \sqrt{\vec{u} \cdot \vec{u}}$

➤ Review: Inner Product, Norm, Metric on vector spaces V

Let V be a (real) vector space. For example, V is a subspace of \mathbb{R}^n .

*Geometry
↓
Norm + angle*

Definition (Inner Product). An inner product on V is a binary function

$$\langle \cdot, \cdot \rangle : V \times V \rightarrow \mathbb{R}$$

such that for vectors $\vec{u}, \vec{v}, \vec{w} \in V$ and a scalar $c \in \mathbb{R}$, the following hold:

$$(1.) \langle \vec{u}, \vec{v} \rangle = \langle \vec{v}, \vec{u} \rangle$$

$$(2.) \langle \vec{u} + \vec{v}, \vec{w} \rangle = \langle \vec{u}, \vec{w} \rangle + \langle \vec{v}, \vec{w} \rangle$$

$$(3.) \langle c\vec{u}, \vec{v} \rangle = c\langle \vec{v}, \vec{u} \rangle$$

$$(4.) \langle \vec{u}, \vec{u} \rangle \geq 0$$

$$(5.) \langle \vec{u}, \vec{u} \rangle = 0 \text{ if and only if } \vec{u} = \vec{0}$$

$$\|\vec{u}\| := \sqrt{\langle \vec{u}, \vec{u} \rangle}$$

We call V an **inner product space** with inner product $\langle \cdot, \cdot \rangle$.

Example: Dot product on \mathbb{R}^n .

$$\text{e.g., } \langle \vec{u}, \vec{v} \rangle := c_1 u_1 v_1 + c_2 u_2 v_2 + \dots + c_n u_n v_n$$

$$c_i > 0$$

Example: Weighted dot product on \mathbb{R}^n .

$$\langle \vec{u}, \vec{v} \rangle_W := \vec{u}^T W \vec{v}$$

$$W = \begin{bmatrix} c_1 & & \\ & \ddots & \\ & & c_n \end{bmatrix}$$

Here, W is a positive-definite symmetric matrix

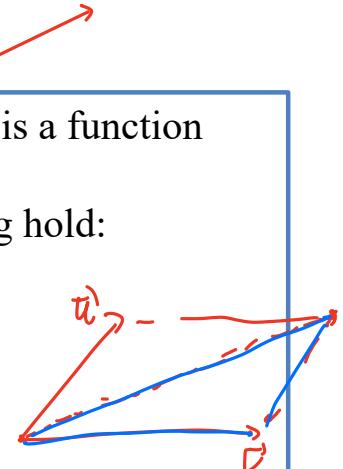

Definition (Norm). Let V be a real vector space. A norm on V is a function

$$\|-\|: V \rightarrow \mathbb{R}$$

such that for vectors $\vec{u}, \vec{v} \in V$ and a scalar $c \in \mathbb{R}$, the following hold:

- (1.) $\|\vec{u}\| \geq 0$
- (2.) $\|\vec{u}\| = 0$ if and only if $\vec{u} = \vec{0}$
- (3.) $\|c\vec{u}\| = |c| \|\vec{u}\|$
- (4.) The triangle inequality $\|\vec{u} + \vec{v}\| \leq \|\vec{u}\| + \|\vec{v}\|$

We call V an normed space with norm $\|-\|$.

Example: l_2 -norm induced by dot product. $\|\vec{u}\|_2 = \|\vec{u}\| = \sqrt{\vec{u} \cdot \vec{u}} = \sqrt{u_1^2 + u_2^2 + \dots + u_n^2}$

Example: l_p -norm on \mathbb{R}^n $\|\vec{u}\|_p = \sqrt[p]{|u_1|^p + |u_2|^p + \dots + |u_n|^p} \neq \sqrt{\langle \vec{u}, \vec{u} \rangle}$

l_1 -norm $\|\vec{u}\|_1 = |u_1| + \dots + |u_n|$

Example: l_p -cost function $L(\vec{\theta}) = \|h_{\vec{\theta}}(X) - \vec{y}\|_p$

Definition (Metric). Let S be a **set**. A metric(distance) on S is a binary function

$$d: S \times S \rightarrow \mathbb{R}$$

such that for vectors $\vec{u}, \vec{v}, \vec{w} \in S$ and a scalar $c \in \mathbb{R}$, the following hold:

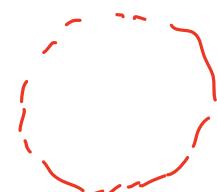

- (1.) $d(\vec{u}, \vec{v}) = d(\vec{v}, \vec{u})$
- (2.) $d(\vec{u}, \vec{v}) = 0$ if and only if $\vec{u} = \vec{v}$
- (3.) $d(\vec{u}, \vec{w}) \leq d(\vec{u}, \vec{v}) + d(\vec{v}, \vec{w})$

We call S a metric space metric function d .

$$d(\vec{u}, \vec{v}) = \|\vec{u} - \vec{v}\|$$

$$\|\vec{u}\| = d(\vec{u}, \vec{0})$$

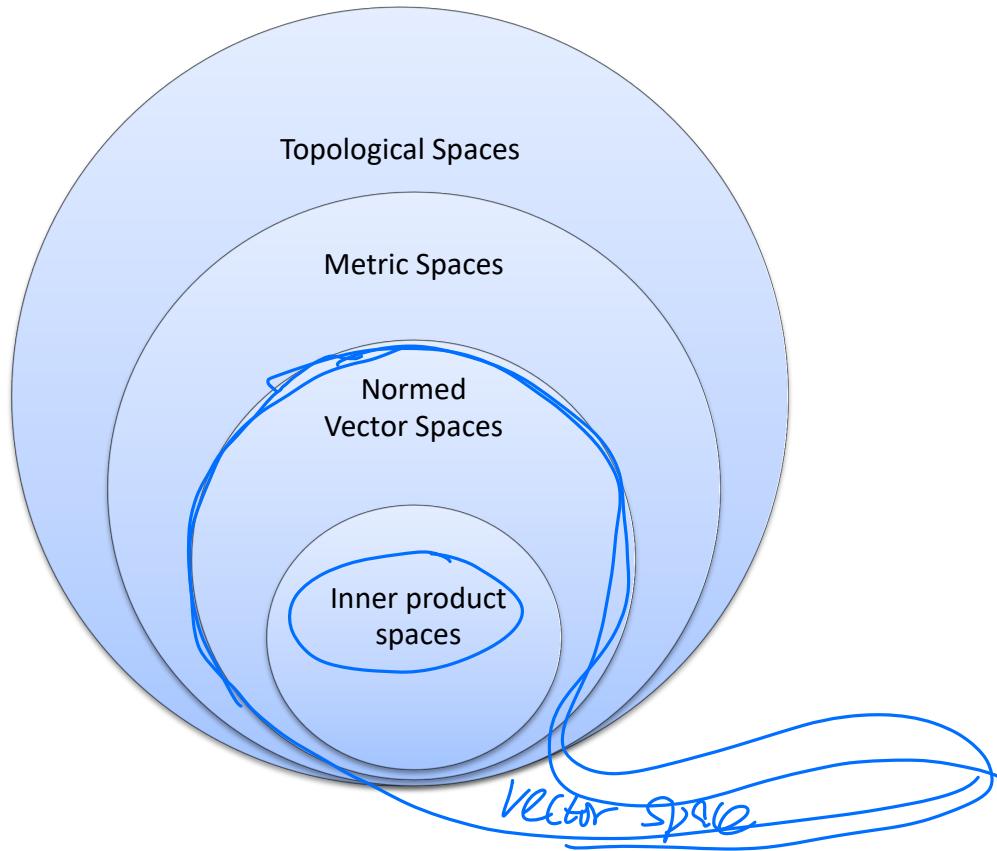

Examples:

1. If S is a **vector space**, metric is equivalent to **norm**.
2. The **discrete metric on S** , where $d(x, y) = 0$ if $x = y$ and $d(x, y) = 1$ otherwise.
3. The **positive real numbers** with distance function $d(x, y) = |\log(y/x)|$ is a metric space.

Given a distance function d on the label space \mathcal{C}^n

- Cost/Loss Function: $L(\vec{\theta}) = d(h_{\theta}(\mathbf{X}), \vec{y})$

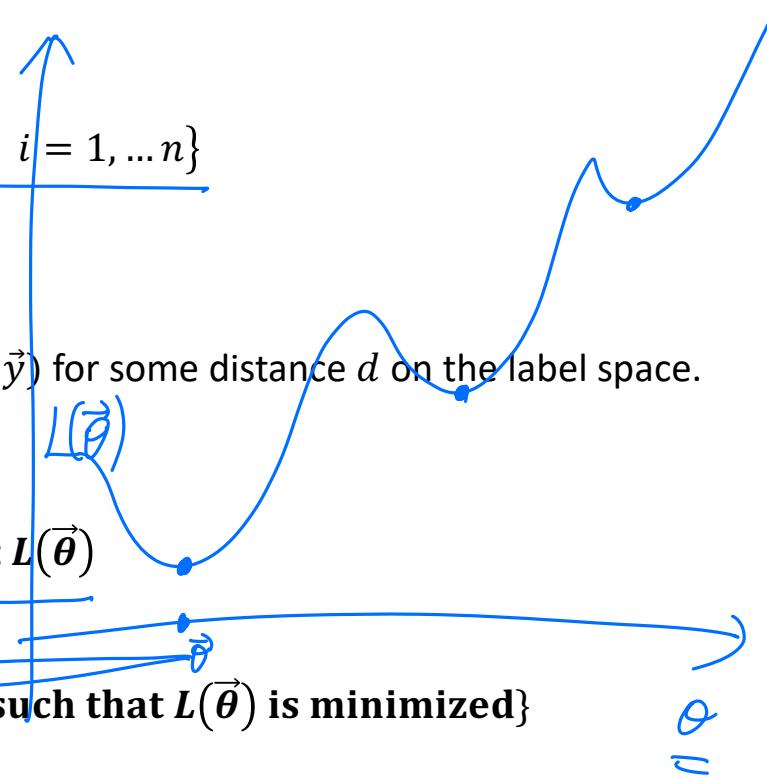

➤ Minimize Cost/Loss Functions

- Given labeled **Data** $\mathcal{D} = \{(\vec{x}^{(i)}, y^{(i)}), i = 1, \dots n\}$
- Assumption(Model): $h_{\theta}(\cdot)$
- Cost/Loss Function: $L(\vec{\theta}) = d(h_{\theta}(X), \vec{y})$ for some distance d on the label space.

Goal: Find $\vec{\theta}$ to minimize the cost $L(\vec{\theta})$

Equivalently, find $\underset{\vec{\theta}}{\operatorname{argmin}} L(\vec{\theta}) = \{\vec{\theta} \text{ such that } L(\vec{\theta}) \text{ is minimized}\}$

➤ Minimize Cost/Loss Functions (linear regression)

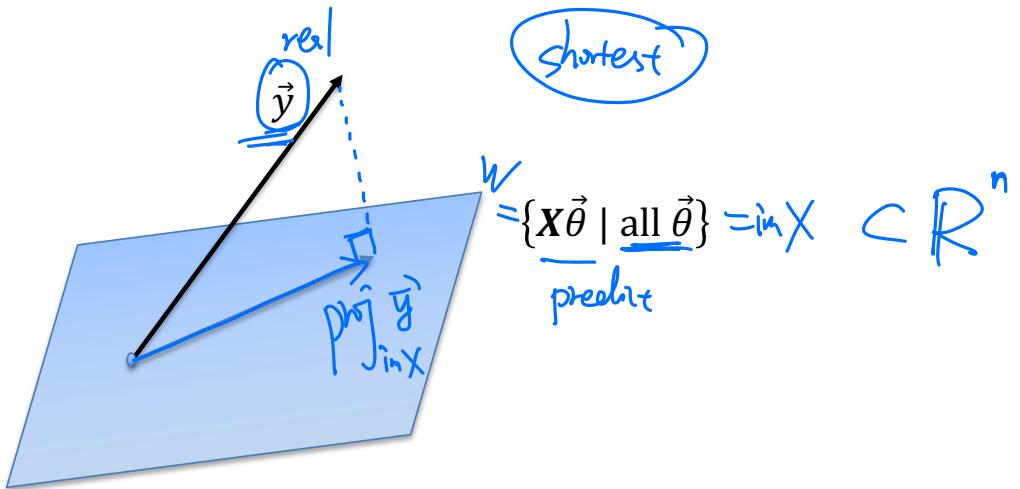

- Given labeled Data $\mathcal{D} = \{(\vec{x}^{(i)}, y^{(i)})\}, i = 1, \dots n\}$, where $y^{(i)} \in \mathbb{R}$

- Assumption(Linear Model): $h_{\theta}(\vec{x}) = \vec{x}^T \vec{\theta}$

- Cost/Loss Function: $L(\vec{\theta}) = d(h_{\theta}(\vec{X}), \vec{y})$ for some distance d on \mathbb{R}^n .

- Find $\underset{\vec{\theta}}{\operatorname{argmin}} L(\vec{\theta}) = \{\vec{\theta} \text{ such that } L(\vec{\theta}) \text{ is minimized}\}$

Minimize the cost is the same as minimize the distance from \vec{y} to $X\vec{\theta}$

- If we the norm/distance is induced by an **inner product**, then the solution of $\underset{\vec{\theta}}{\operatorname{argmin}} L(\vec{\theta})$ is

$$X \vec{\theta} = \operatorname{Proj}_{\operatorname{im}(X)} \vec{y}$$

$$\|\vec{u}\| = \sqrt{\vec{u} \cdot \vec{u}}$$

- If we the norm is induced by **dot product**, the cost function is the residual sum of squares:

$$L(\vec{\theta}) = \underline{RSS}(\vec{\theta}) := \|h_{\vec{\theta}}(X) - \vec{y}\|^2 = \|X\vec{\theta} - \vec{y}\|^2 = \sum_{i=1}^n \left((\vec{x}^{(i)})^T \vec{\theta} - y^{(i)} \right)^2$$

then the solution of $\underset{\vec{\theta}}{\operatorname{argmin}} L(\vec{\theta})$ is obtained by solving

$$X^T X \vec{\theta} = X^T \vec{y}$$

This is called the **normal equation** of $X\vec{\theta} = \vec{y}$

Lemma: Rank $X^T X$ = Rank X

X
 $n \times \underline{d+1}$

51/0

- If rank $X = d + 1$, then $X^T X$ is invertible.

In this case, the solution for the normal equation is unique

$$\arg \min_{\vec{\theta}} \text{RSS}(\vec{\theta}) = \boxed{\vec{\theta} = (X^T X)^{-1} X^T \vec{y}}$$

$n \times (d+1)$

$$Q^T Q = I_{d+1}$$

- If rank $X = d + 1$ and $X = QR$ where Q is an orthogonal matrix and R is an upper triangular matrix, then the solution for the normal equation is

$$\vec{\theta} = R^{-1} Q^T \vec{y}$$

$\arg \min_{\vec{\theta}} \text{RSS}(\vec{\theta})$

Assume $h_{\theta}(\vec{x}) = \vec{x}^T \vec{\theta}$

Remarks:

- If we the norm $\|\vec{u}\|_W := \langle \vec{u}, \vec{u} \rangle_W$ is induced by weighted inner product $\langle \vec{u}, \vec{v} \rangle_W := \boxed{\vec{u}^T W \vec{v}}$ the cost function is the:

$$L(\vec{\theta}) = \|X\vec{\theta} - \vec{y}\|_W^2 = (\vec{X}\vec{\theta} - \vec{y})^T W (\vec{X}\vec{\theta} - \vec{y})$$

The solution of $\underset{\vec{\theta}}{\operatorname{argmin}} L(\vec{\theta})$ is by solving the weighted normal equation

$$\boxed{X^T W X \vec{\theta} = X^T W \vec{y}}$$

$$W = \begin{bmatrix} c_1 & c_2 & \dots & c_n \end{bmatrix}$$

$$p \neq 2$$

$$c_i > 0$$

- If the norm is not induced by inner product (e.g., the l_p -norm), then finding $\underset{\vec{\theta}}{\operatorname{argmin}} L(\vec{\theta})$ is a hard optimization question. We will need to use gradient descent or Newton's method to minimize the cost $L(\vec{\theta})$)

➤ Matrix Calculus

$$h_{\vec{\theta}}(\vec{x}) = \vec{x}^T \vec{\theta} , \quad RSS(\vec{\theta})$$

$$RSS(\vec{\theta}) = \|X\vec{\theta} - \vec{y}\|^2 = (X\vec{\theta} - \vec{y})^T (X\vec{\theta} - \vec{y})$$

$$= (\vec{\theta}^T X^T - \vec{y}^T) (X\vec{\theta} - \vec{y})$$

$$\begin{bmatrix} \theta_0 & \theta_1 & \dots & \theta_d \end{bmatrix} \begin{bmatrix} \vdots & \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \vdots \end{bmatrix} \begin{bmatrix} \theta_0 \\ \theta_1 \\ \vdots \\ \theta_d \end{bmatrix} = \vec{\theta}^T X^T X \vec{\theta} - \vec{\theta}^T X^T \vec{y} - \vec{y}^T X \vec{\theta} + \vec{y}^T \vec{y}$$

$$= (\vec{\theta}^T X^T X \vec{\theta}) - 2\vec{y}^T X \vec{\theta} + \vec{y}^T \vec{y}$$

$$\sum_{i,j} (\quad) \theta_i \theta_j$$

Quadratic

Linear

Constant

$$\begin{bmatrix} \theta_0 \\ \theta_1 \\ \vdots \\ \theta_d \end{bmatrix}$$

To minimize $RSS(\vec{\theta})$ we need to find critical points.

$$\underset{\vec{\theta}}{\operatorname{argmin}} RSS(\vec{\theta})$$

e.g. $RSS(\vec{\theta}) = \theta_0^2 + 3\theta_1\theta_2 + \theta_2^2 + 3\theta_1 + 2\theta_2 + 3$

➤ Matrix Calculus

Definitions. (Gradient/Partial derivative)

(1) If $f: \mathbb{R}^n \rightarrow \mathbb{R}$, the **gradient** of f is defined to be

$$\vec{x} = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix}$$

$$\frac{\partial f}{\partial \vec{x}} := \nabla_{\vec{x}} f := \begin{bmatrix} \frac{\partial f}{\partial x_1} \\ \vdots \\ \frac{\partial f}{\partial x_n} \end{bmatrix}$$

$$: \mathbb{R}^n \rightarrow \mathbb{R}$$

(2) If $f: \mathbb{R}^{m \times n} \rightarrow \mathbb{R}$, the **gradient** of f is defined to be

$$\vec{x} = \begin{bmatrix} x_{11} & \dots & x_{1n} \\ \vdots & & \vdots \\ x_{m1} & \dots & x_{mn} \end{bmatrix}$$

$$\frac{\partial f}{\partial X} := \nabla_X f := \begin{bmatrix} \frac{\partial f}{\partial x_{11}} & \dots & \frac{\partial f}{\partial x_{1n}} \\ \vdots & \ddots & \vdots \\ \frac{\partial f}{\partial x_{m1}} & \dots & \frac{\partial f}{\partial x_{mn}} \end{bmatrix}$$

$$\begin{bmatrix} f_1(\vec{x}) \\ \vdots \end{bmatrix}$$

E.g. $F(\vec{x}) = \begin{bmatrix} x_1^2 + x_2^2 \\ x_1 x_2 \\ x_1 + x_2 \end{bmatrix}$

$$F(\vec{x}) = \begin{bmatrix} f_1(\vec{x}) \\ \vdots \\ f_m(\vec{x}) \end{bmatrix}$$

(3) If $F: \mathbb{R}^n \rightarrow \mathbb{R}^m$, the **derivative** of F is defined to be

$$\vec{x} = \begin{bmatrix} x_1 \\ \vdots \\ x_n \end{bmatrix}$$

$$\frac{\partial F}{\partial \vec{x}} := \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \dots & \frac{\partial f_m}{\partial x_1} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_1}{\partial x_n} & \dots & \frac{\partial f_m}{\partial x_n} \end{bmatrix}$$

$$\mathbb{R}^n \rightarrow \mathbb{R}^m$$

$$\frac{\partial f_i}{\partial x_j}$$

Remark: The above notation is called **denominator layout** notation. There is another **numerator layout** convention for the derivative of F , which is the transpose of the denominator layout

$$\begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \dots & \frac{\partial f_1}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_m}{\partial x_1} & \dots & \frac{\partial f_m}{\partial x_n} \end{bmatrix}$$

Theorem(Linear Property)

Let f and g be functions and c be a real number.

$$(1) \nabla(f + g) = \nabla f + \nabla g$$

$$(2) \nabla(cf) = c\nabla f$$

Here ∇ can be $\nabla_{\vec{x}}$, or ∇_X , or $\frac{\partial}{\partial \vec{x}}$

Proposition: If $f(\vec{x}) = \vec{b}^T \vec{x}$, then $\nabla f = \vec{b}$.

$$[\underline{b_1 \dots b_n}] \begin{bmatrix} \vec{x}_1 \\ \vdots \\ \vec{x}_n \end{bmatrix} = b_1 x_1 + \dots + b_n x_n$$

$$\nabla f = \begin{bmatrix} \frac{\partial f}{\partial x_1} \\ \vdots \\ \frac{\partial f}{\partial x_n} \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_n \end{bmatrix} = \vec{b}$$

$$A\vec{x} = \begin{bmatrix} a_{11} & \dots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{m1} & \dots & a_{mn} \end{bmatrix} \begin{bmatrix} x_1 \\ \vdots \\ x_n \end{bmatrix}$$

A $m \times n$ matrix

$\mathbb{R}^n \rightarrow \mathbb{R}^m$

Proposition: If $F(\vec{x}) = A\vec{x}$, then $\frac{\partial F}{\partial \vec{x}} = A^T$

$$\frac{\partial F}{\partial \vec{x}} := \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \dots & \frac{\partial f_m}{\partial x_1} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_1}{\partial x_n} & \dots & \frac{\partial f_m}{\partial x_n} \end{bmatrix} = \begin{bmatrix} a_{11} & \dots & a_{1n} \\ \vdots & \ddots & \vdots \\ a_{m1} & \dots & a_{mn} \end{bmatrix} = A^T$$

$$f_1(\vec{x}) = a_{11}x_1 + \dots + a_{1n}x_n$$

$$\vdots$$

$$f_m(\vec{x}) = a_{m1}x_1 + \dots + a_{mn}x_n$$

Proposition: (quadratic function):

- If $f(\vec{x}) = \vec{x}^T A \vec{x}$, then $\nabla f = (A^T + A)\vec{x}$

Proof: $f(\vec{x}) = \vec{x}^T A \vec{x} = \sum_{i=1}^n \sum_{j=1}^n a_{ij} x_i x_j$

$f: \mathbb{R}^n \rightarrow \mathbb{R}$

A $n \times n$ matrix

$$\nabla f = \begin{bmatrix} \frac{\partial f}{\partial x_1} \\ \vdots \\ \frac{\partial f}{\partial x_n} \end{bmatrix} = \begin{bmatrix} \sum_{i=1}^n a_{i1} x_i + \sum_{j=1}^n a_{1j} x_j \\ \vdots \\ \sum_{i=1}^n a_{in} x_i + \sum_{j=1}^n a_{nj} x_j + \end{bmatrix} = A^T \vec{x} + A \vec{x}.$$

→ If $A^T = A$ then $\nabla f = 2A\vec{x}$

Example: $J(\vec{\theta}) = \underline{RSS(\vec{\theta})} = \underline{\vec{\theta}^T \mathbf{X}^T \mathbf{X} \vec{\theta}} - 2\underline{\vec{y}^T \mathbf{X} \vec{\theta}} + \underline{\vec{y}^T \vec{y}}$

$$\nabla_{\vec{\theta}} J = 2 \mathbf{X}^T \mathbf{X} \vec{\theta} - 2 \mathbf{X}^T \vec{y} = 0$$

\Rightarrow critical points by $\boxed{\mathbf{X}^T \mathbf{X} \vec{\theta} = \mathbf{X}^T \vec{y}}$

normal equation

$$\underline{m \leq n}$$

$$(f \cdot g)' = f \cdot g' + f' \cdot g$$

Theorem: (Product Rule) (denominator layout)

Suppose $F: \mathbb{R}^n \rightarrow \mathbb{R}^m$ and $G: \mathbb{R}^n \rightarrow \mathbb{R}^m$ and $H = G^T F$. Then,

$$\begin{bmatrix} f_1(\vec{z}) \\ \vdots \\ f_m(\vec{z}) \end{bmatrix}$$

$$\frac{\partial H}{\partial \vec{z}} = \frac{\partial G}{\partial \vec{z}} F + \frac{\partial F}{\partial \vec{z}} G$$

$$\frac{\partial H}{\partial \vec{z}} = \begin{bmatrix} \frac{\partial H}{\partial z_1} \\ \vdots \\ \frac{\partial H}{\partial z_n} \end{bmatrix}$$

Pf:

$$H = G^T F = [g_1 \dots g_m] \begin{bmatrix} f_1 \\ \vdots \\ f_m \end{bmatrix} = g_1 f_1 + \dots + g_m f_m$$

$$\frac{\partial H}{\partial z_i} = \left(\frac{\partial g_1}{\partial z_i} \cdot f_1 + \frac{\partial g_1}{\partial z_i} g_1 \right) + \dots + \left(\frac{\partial g_m}{\partial z_i} f_m + \frac{\partial f_m}{\partial z_i} g_m \right)$$

$$= \frac{\partial G}{\partial z_i} F + \frac{\partial F}{\partial z_i} G$$

for each $i=1, 2, \dots, n$

Definition: The **Hessian matrix** of $f: \mathbb{R}^n \rightarrow \mathbb{R}$ is defined by

$$H(f) := \begin{bmatrix} \frac{\partial^2 f}{\partial x_1^2} & \dots & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \dots & \frac{\partial^2 f}{\partial x_n^2} \end{bmatrix}$$

$$\frac{\partial^2 f}{\partial x_i \partial x_j} = \frac{\partial^2 f}{\partial x_j \partial x_i}$$

Proposition: If $f(\vec{x}) = \vec{b}^T \vec{x}$, then $H(f) = \underline{0}$.

Proposition: If $f(\vec{x}) = \vec{x}^T A \vec{x}$, for a symmetric matrix A , then $\underline{H(f) = 2A}$

Example: $J(\vec{\theta}) = \underline{RSS(\vec{\theta})} = \vec{\theta}^T \underline{X^T X \vec{\theta}} - 2\vec{y}^T \underline{X \vec{\theta}} + \vec{y}^T \vec{y}$

$$H(J) = 2\underline{X^T X}$$

Symmetric
positive-semidefinite

Theorem: (Second Derivative Test)

If $f: \mathbb{R}^n \rightarrow \mathbb{R}$ is smooth, then a critical point $\vec{a} \in \mathbb{R}^n$ (i.e., $\nabla f(\vec{a}) = \vec{0}$) is

- (1) a local minimum if $H(f(\vec{a}))$ is positive definite; \Leftrightarrow (all eigenvalues > 0)
- (2) a local maximum if $H(f(\vec{a}))$ is negative definite; \Leftrightarrow (all eigenvalues < 0)
- (3) a saddle point if $H(f(\vec{a}))$ contains positive and negative eigenvalues;
- (4) there is no conclusion for the other cases.

Examples:

$$\nabla f = \begin{pmatrix} 2x \\ 2y \end{pmatrix} = \vec{0}$$

$$\vec{a} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

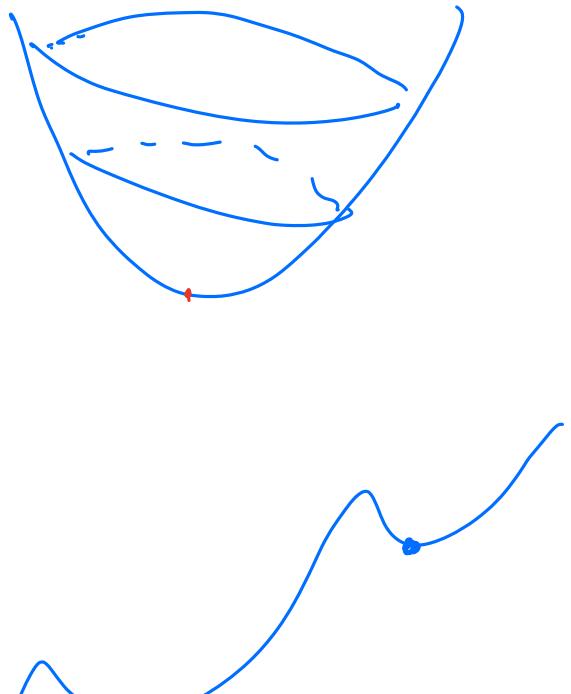

$$f(x, y) = x^2 + y^2$$

$$H = \begin{pmatrix} 2 & 0 \\ 0 & 2 \end{pmatrix}$$

$$f(x, y) = -x^2 - y^2$$

$$f(x, y) = x^2 - y^2$$

$$H = \begin{pmatrix} 2 & 0 \\ 0 & -2 \end{pmatrix}$$

$$f(x, y) = -x^4$$

$$f(x, y) = x^4$$

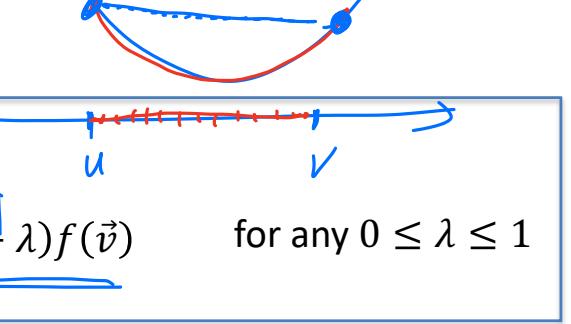

$$f(x, y) = x^2 + y^3$$

Example: $f(x, y) = (x + y)(xy + xy^2)$

Definition: A function $f: \mathbb{R}^n \rightarrow \mathbb{R}$ is **convex** if

$$f(\lambda \vec{u} + (1 - \lambda)\vec{v}) \leq \lambda f(\vec{u}) + (1 - \lambda)f(\vec{v}) \quad \text{for any } 0 \leq \lambda \leq 1$$

Definition: A set C is **convex** if and only if

$$\vec{u}, \vec{v} \in C \implies \lambda \vec{u} + (1 - \lambda)\vec{v} \in C \text{ for any } 0 \leq \lambda \leq 1$$

Theorem: A function $f: \mathbb{R}^n \rightarrow \mathbb{R}$ is smooth and convex if and only if

$$f(\vec{u}) - f(\vec{v}) \geq \nabla f \cdot (\vec{u} - \vec{v}) \quad \text{for all } \vec{u}, \vec{v}$$

- Any local minimum of a convex function is also a global minimum.

- If its Hessian $H(f(\vec{x}))$ is everywhere positive semi-definite, then f is convex.

any \vec{x}
